## Abstract

1. Ecosystems are complex and sparsely observed making inference and prediction challenging.
2. Empirical dynamic modelling (EDM) circumvents the need for a parametric model and complete observations of all system variables. Classical univariate approaches, which require time-series observations of only a single focal variable, can produce verifiable out-of-sample forecasts; however, they can sometimes require long time series that may be difficult to obtain. More importantly, classical approaches limit the depth of mechanistic understanding that can be gained and the generalizability of forecasts to non-analogue futures.
3. We review the main ideas of EDM and more recent extensions that expand their capabilities for improving forecasts and understanding mechanism.
4. Algorithms are now available that allow for missing data, unequal sampling intervals and combining short time series, which increase the number of datasets that can be used. Recent extensions of EDM to multivariate time series substantially expand the range of applications and mechanistic questions that can be addressed, including detecting causal coupling, tracking changing interactions in real time, leveraging short time series from information shared in coupled variables, modelling dynamically changing stability, scenario exploration, and management applications involving optimal control.

*This article is about the physical properties of greenhouse gases. For how human activities are adding to greenhouse gases, see Greenhouse gas emissions.*

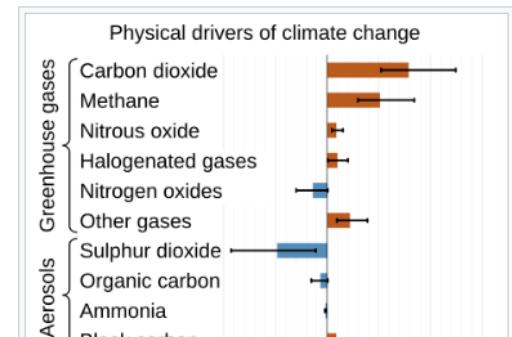

**Greenhouse gases (GHGs)** are the gases in the [atmosphere](#) that raise the surface temperature of [planets](#) such as the Earth. What distinguishes them from other gases is that they [absorb the wavelengths of radiation](#) that a [planet emits](#), resulting in the [greenhouse effect](#).<sup>[1]</sup> The Earth is warmed by sunlight, causing its surface to [radiate heat](#), which is then mostly absorbed by greenhouse gases. Without greenhouse gases in the atmosphere, the average temperature of [Earth's surface](#) would be about  $-18^{\circ}\text{C}$  ( $0^{\circ}\text{F}$ ),<sup>[2]</sup> rather than the present average of  $15^{\circ}\text{C}$  ( $59^{\circ}\text{F}$ ).<sup>[3][4]</sup>

The five most abundant greenhouse gases in Earth's atmosphere, listed in decreasing order of average global [mole fraction](#), are:<sup>[5][6]</sup> [water vapor](#), [carbon dioxide](#), [methane](#), [nitrous oxide](#), [ozone](#). Other greenhouse gases of concern include [chlorofluorocarbons](#) (CFCs and HFCs), [hydrofluorocarbons](#) (HFCs), [perfluorocarbons](#),  $\text{SF}_6$ , and  $\text{NF}_3$ . Water vapor causes about half of the greenhouse effect, acting in response to other gases as a [climate change feedback](#).<sup>[7]</sup>

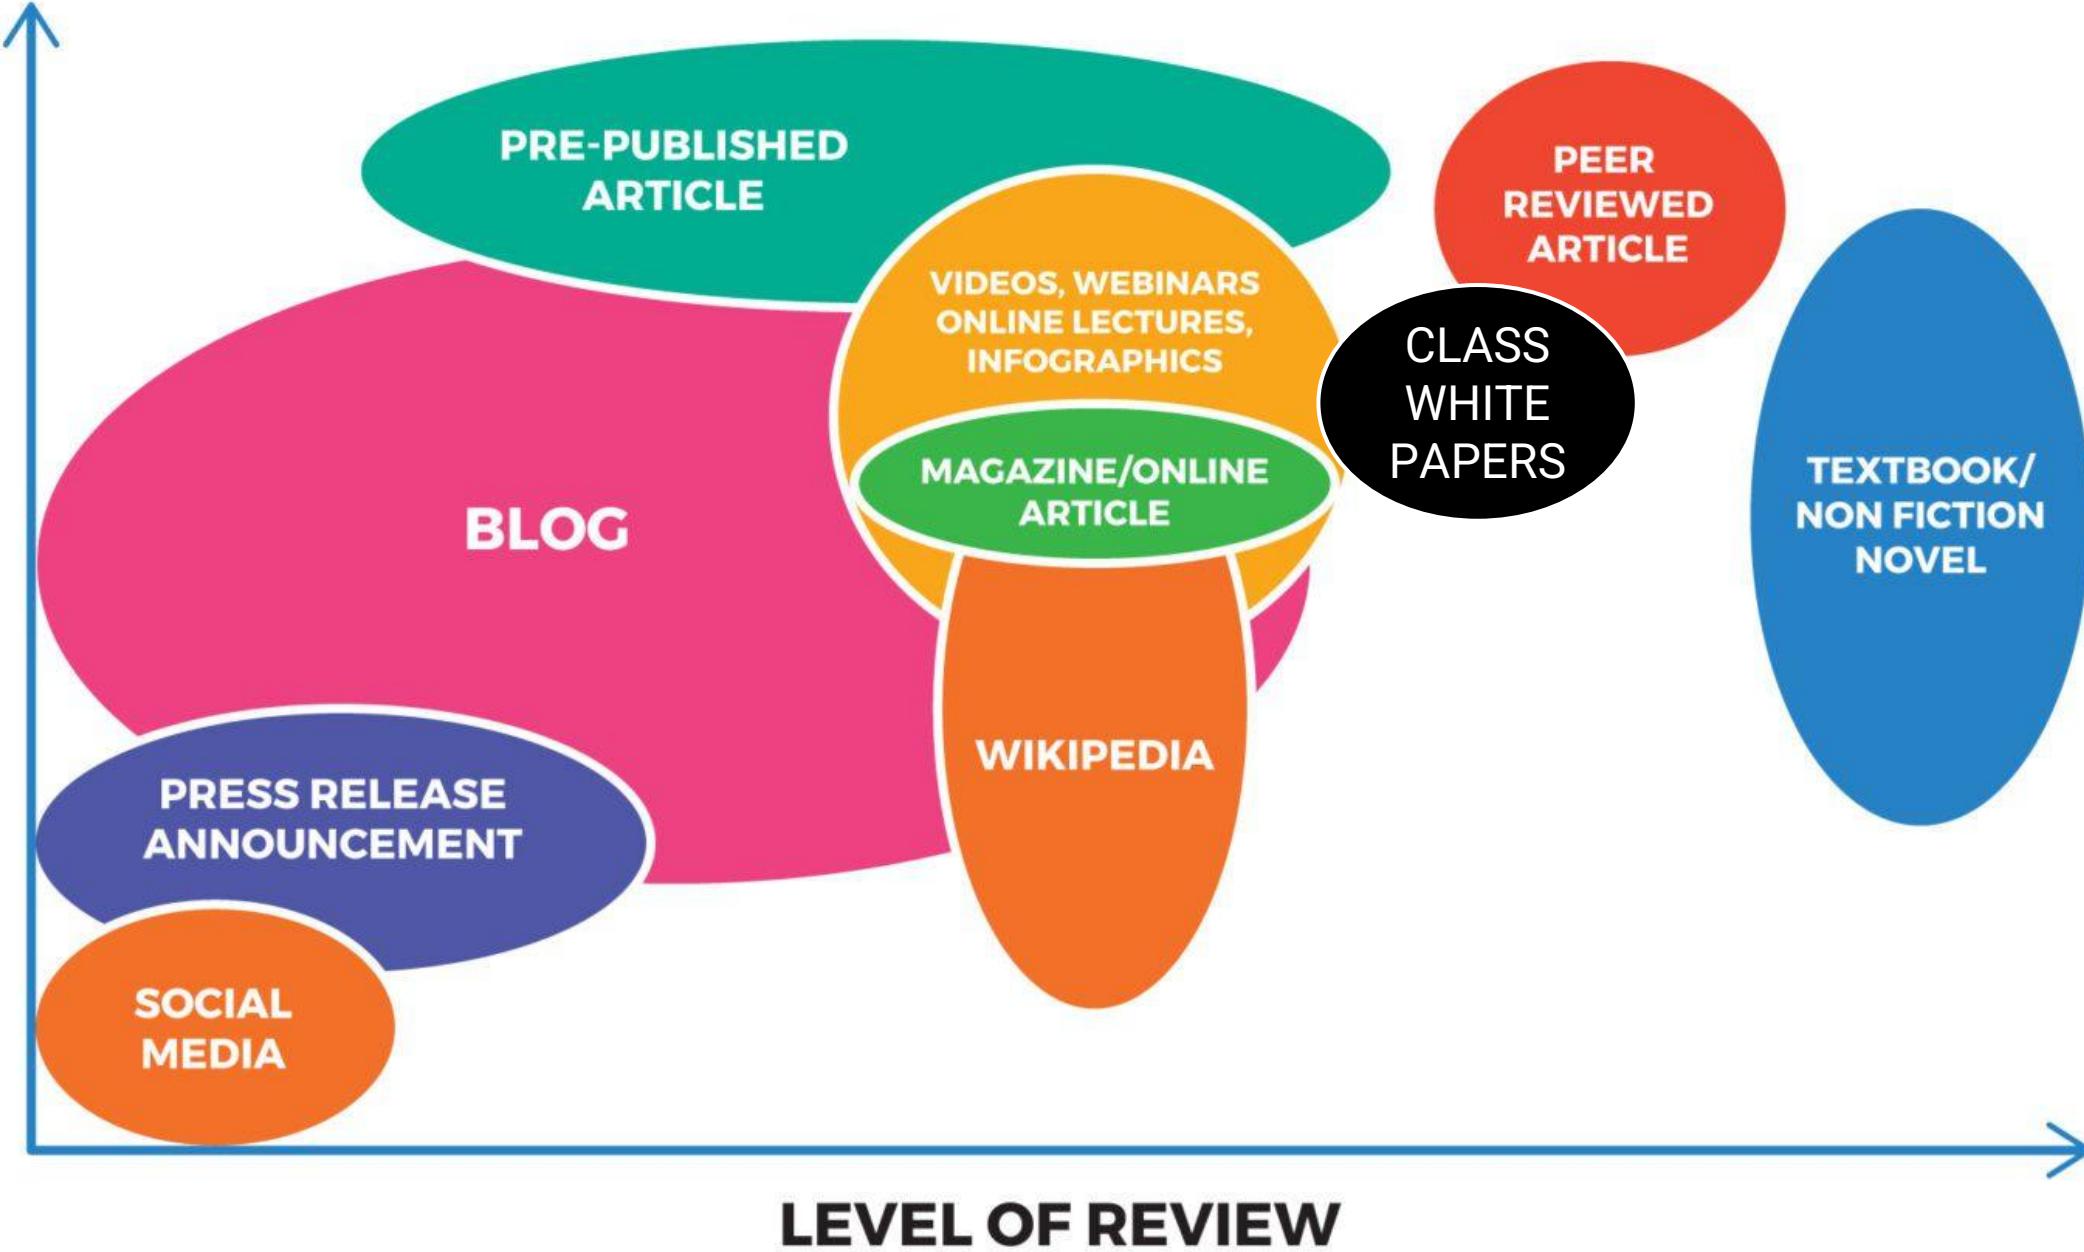

Human activities since the beginning of the [Industrial Revolution](#) (around 1750) have increased [carbon dioxide](#) by over 50%,<sup>[8]</sup> and methane levels by 150%.<sup>[9]</sup> Carbon dioxide emissions are causing about three-quarters of [global warming](#), while [methane emissions](#) cause most of the rest.<sup>[10]</sup> The vast majority of [carbon dioxide emissions](#) by humans come from the burning of [fossil fuels](#),<sup>[11]</sup> with remaining contributions from [agriculture](#) and [industry](#).<sup>[12]:687</sup> Methane emissions originate from agriculture, fossil fuel production, waste, and other sources.<sup>[13]</sup> The [carbon cycle](#) takes thousands of

Greenhouse gases trap some of the heat that results when sunlight heats the Earth's surface. Three important greenhouse gases are shown symbolically in this image: carbon dioxide, water vapor, and methane.

# Measles

Article Talk Read View source View history Tools

From Wikipedia, the free encyclopedia

This article is about the disease. For other uses, see [Measles \(disambiguation\)](#).  
Not to be confused with either [rubella](#) or [roseola](#), which are also viral diseases with comparable features.

**Measles** (probably from Middle Dutch or Middle High German *masel(e)* ("blemish, blood blister"))<sup>[1]</sup> is a highly contagious, vaccine-preventable infectious disease caused by measles virus.<sup>[3][5][12][13][14]</sup> Other names include *morbilli*, *rubeola*, *red measles*, and *English measles*.<sup>[1][2]</sup> Both *rubella*, also known as *German measles*, and *roseola* are different diseases caused by unrelated viruses.<sup>[15]</sup>

Symptoms usually develop 10–12 days after exposure to an infected person and last 7–10 days.<sup>[7][8]</sup> Initial symptoms typically include [fever](#), often greater than 40 °C (104 °F), [cough](#), [runny nose](#), and [inflamed eyes](#).<sup>[3][4]</sup> Small white spots known as [Koplik's spots](#) may form inside the mouth two or three days after the start of symptoms.<sup>[4]</sup> A red, flat rash which usually starts on the face and then spreads to the rest of the body typically begins three to five days after the start of symptoms.<sup>[4]</sup> Common complications include [diarrhea](#) (in 8% of cases), [middle ear infection](#) (7%), and [pneumonia](#) (6%).<sup>[5]</sup> These occur in part due to measles-induced [immunosuppression](#).<sup>[6]</sup> Less commonly [seizures](#), [blindness](#), or [inflammation of the brain](#) may occur.<sup>[5][7]</sup>

Measles is an [airborne disease](#) which spreads easily from one person to the next through the [coughs](#) and [sneezes](#) of infected people.<sup>[7]</sup> It may also be spread through direct contact with mouth or [nasal secretions](#).<sup>[16]</sup> It is extremely contagious: nine out of ten people who are not immune and share living space with an infected person will be infected.<sup>[5]</sup> Furthermore, measles's [reproductive number](#) estimates vary beyond the frequently cited range of 12 to 18,<sup>[17]</sup> with a 2017 review giving a range of 3.7 to 203.3.<sup>[18]</sup> People are infectious to others from four days before to four days after the start of the rash.<sup>[5]</sup> While often regarded as a childhood illness, it can affect people of

**Measles**

**Other names** Morbilli, rubeola, red measles, English measles<sup>[1][2]</sup>

A child showing a day-four measles rash

**Specialty** Infectious disease

**Symptoms** Fever, cough, runny nose, inflamed eyes, rash<sup>[3][4]</sup>

**Complications** Pneumonia, seizures, encephalitis, subacute sclerosing panencephalitis,

### Finding Journal Articles

#### To search by subject...

Go to the list of [subject-specific databases](#). These databases index articles by subject area and are mostly proprietary (WU Libraries subscribe to them).

- Choose a database that is related to your subject of interest.
- Search the database using keywords and phrases (important words and concepts) that describe your topic.
- Look through the resulting citations and determine which of the articles most closely match your topic. Note: Typically, many but not all articles will be available in full-text in the database.

 best feature	microsoft word integration	free for anyone	suggests related documents	user friendly

\*there is a web version as well but it has restricted functionality

\*\*only available post-graduation if BYU maintains subscription to Refworks

## II. Reading Papers Critically

# Why is it important to read the literature?

Papers provide a current understanding of the field

Articles include enough information for you to repeat the study

The results, figures, and tables present actual data

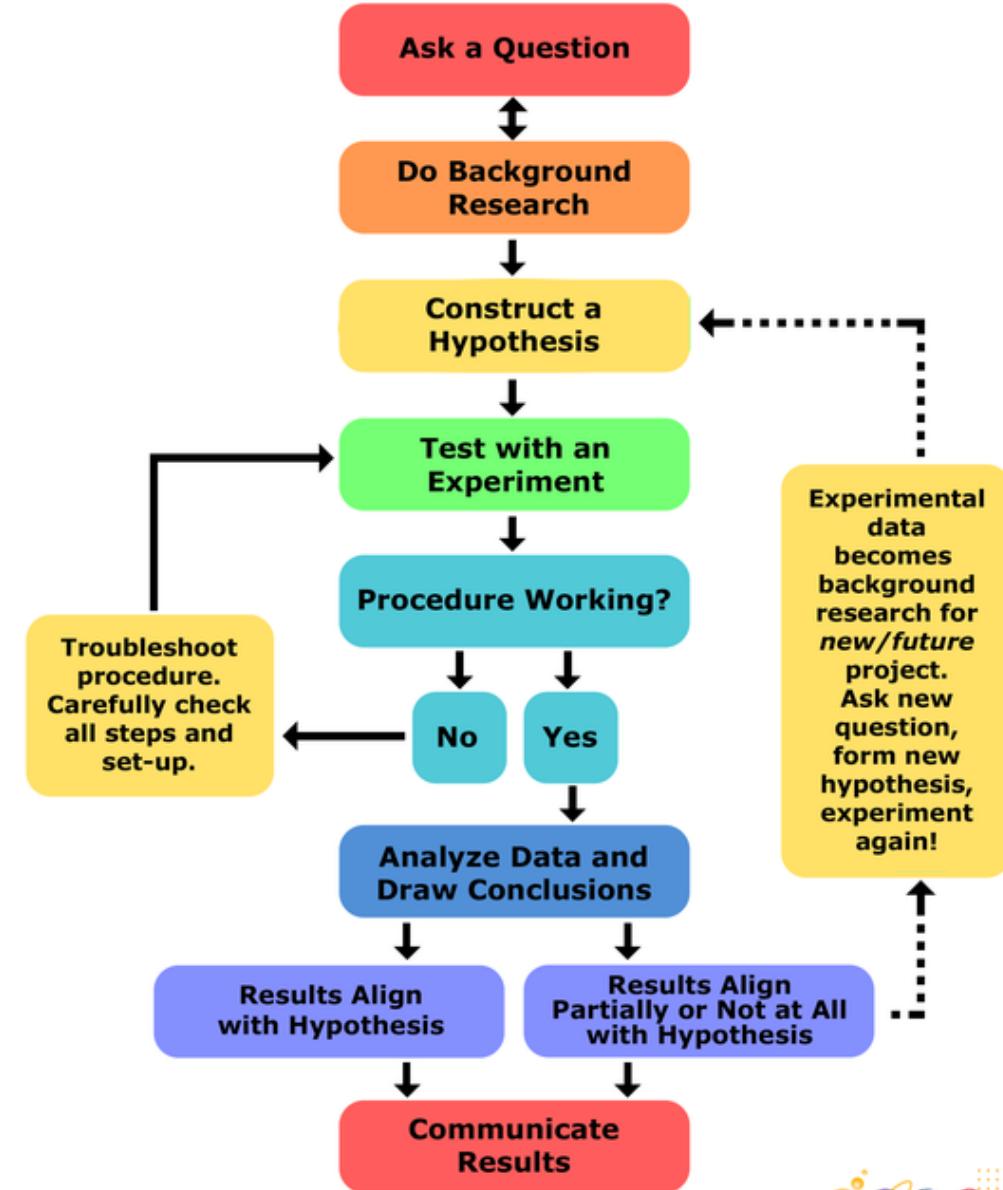

Papers show the reasoning behind conclusions, which you can judge for yourself

# Typical paper sections

- Abstract
- Introduction
- Materials and methods
- Results
- Discussion
- Acknowledgements
- References

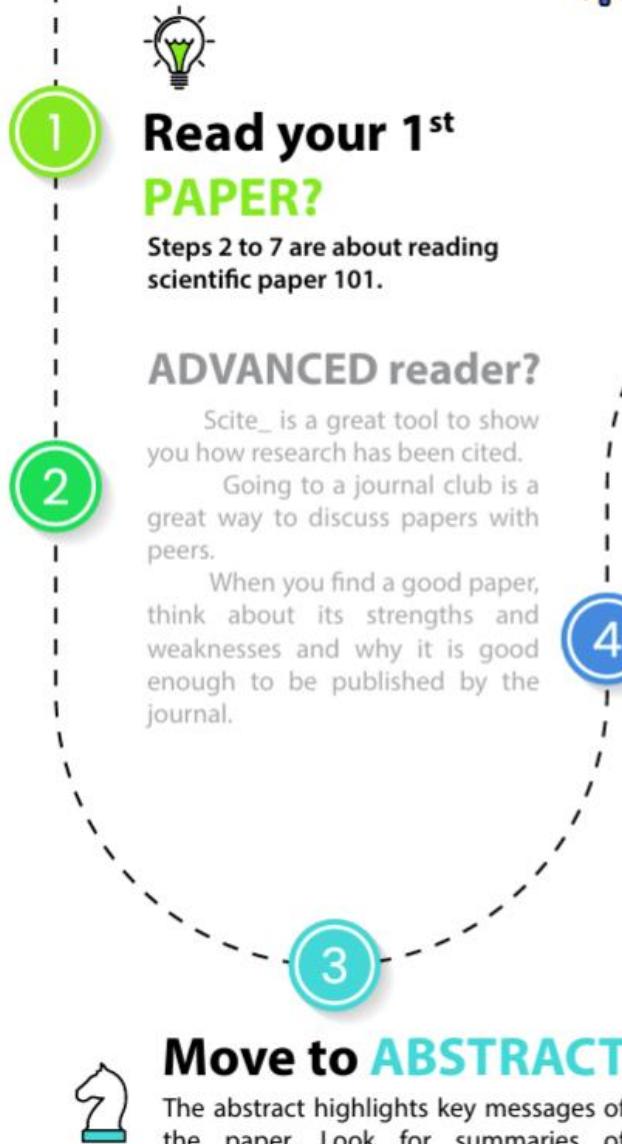

**What steps of the scientific method belong in each paper section?**

## Scientific Method

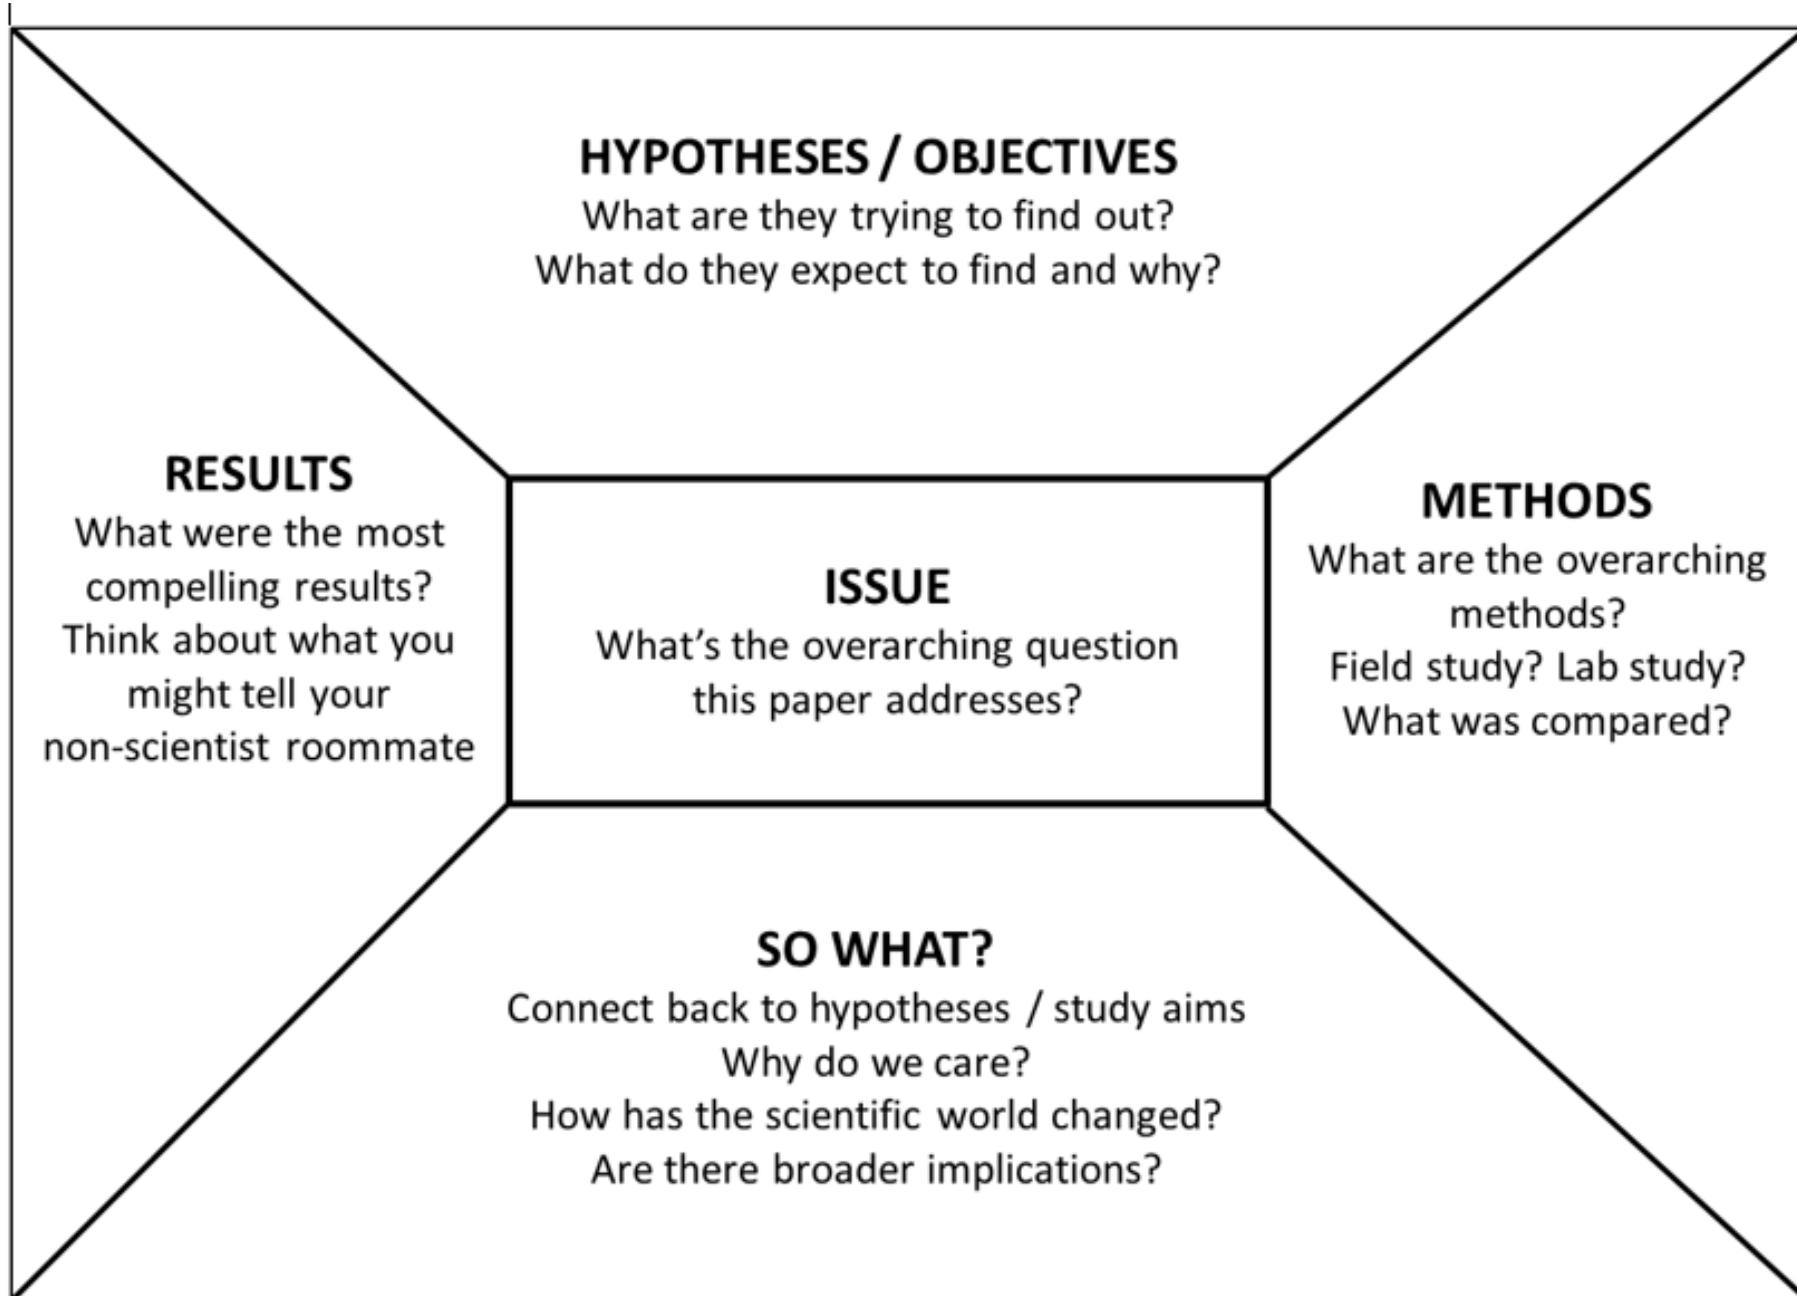

## Start with **TITLE**

The title has key info of the paper. Skim it for key words you are interested in. If you find any, move to 3; if not, restart from another paper.

# Questions to ask yourself while reading

- Is the organization of the article satisfactory?
- Does the introduction set the manuscript in an appropriate context and show how it builds on previous work on the subject?
- Are the methods correctly described and sufficiently informative to allow replication of the research?
- Are the data analyzed using the appropriate statistical methods?
- Are the authors' claims supported by the evidence provided?
- Are the interpretations and conclusions sound, justified by the data and consistent with the paper's objectives?

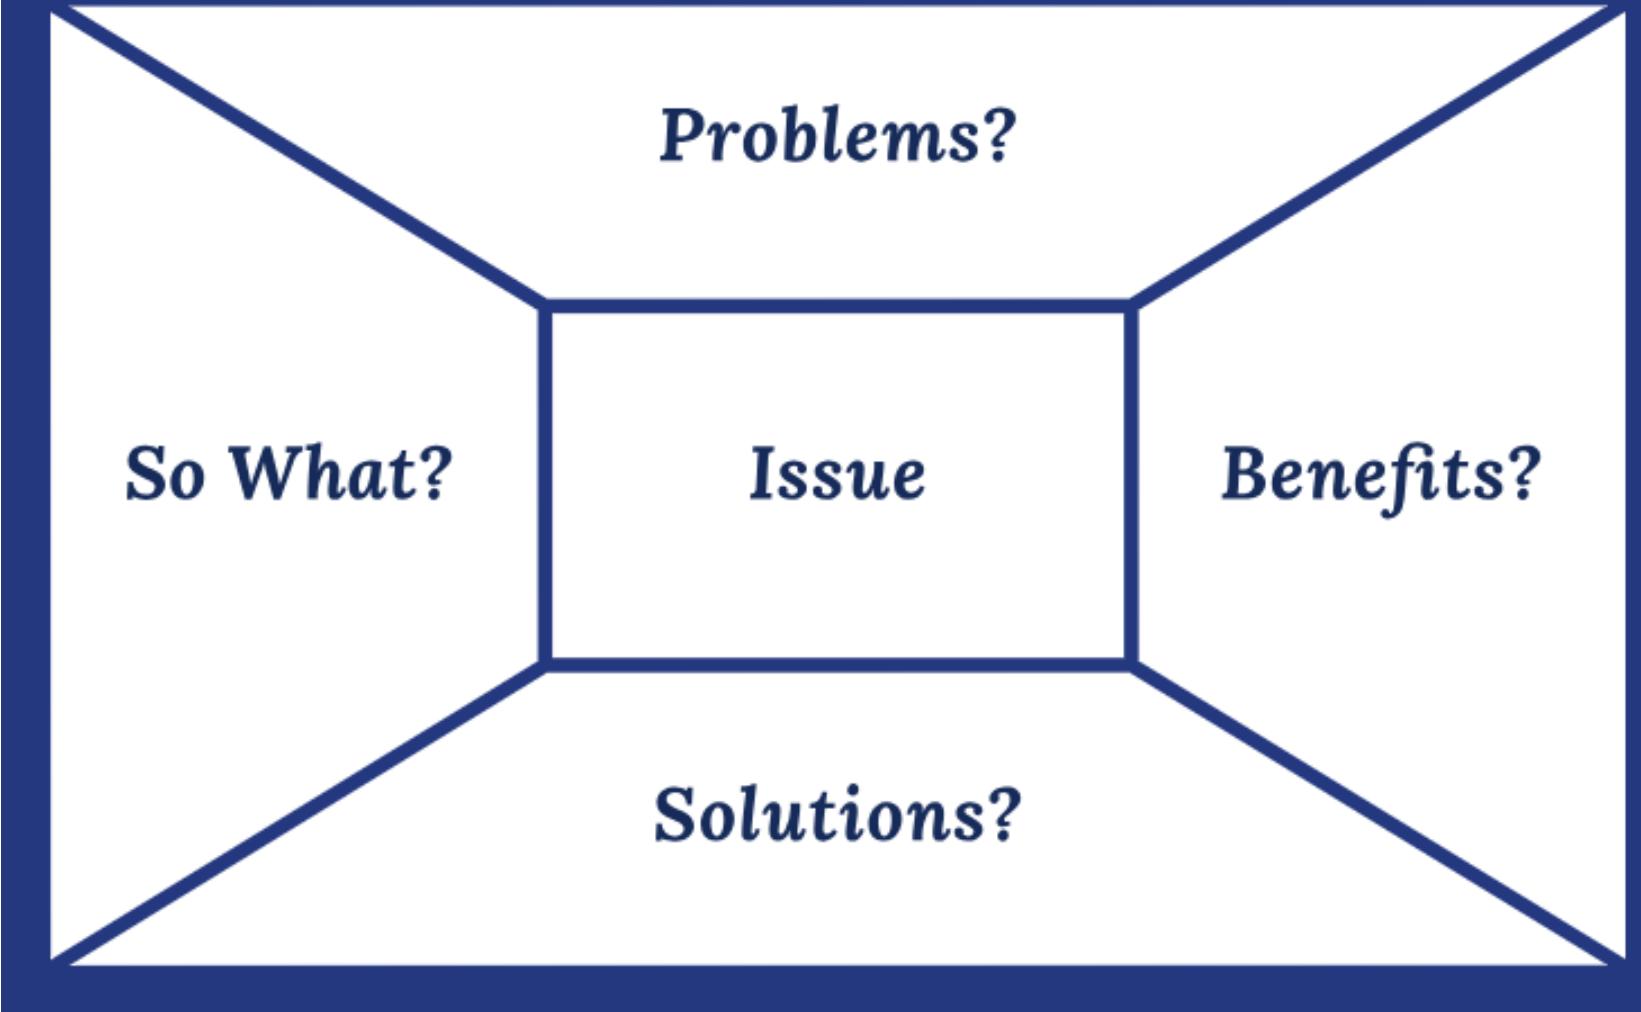

# III. Scientific Writing

# The Message Box

After you've identified your audience, you're ready to start drafting your Message Box! You can begin anywhere. Click on the sections below to learn more about each, and [download a blank Message Box](#) to print and fill out as you go.

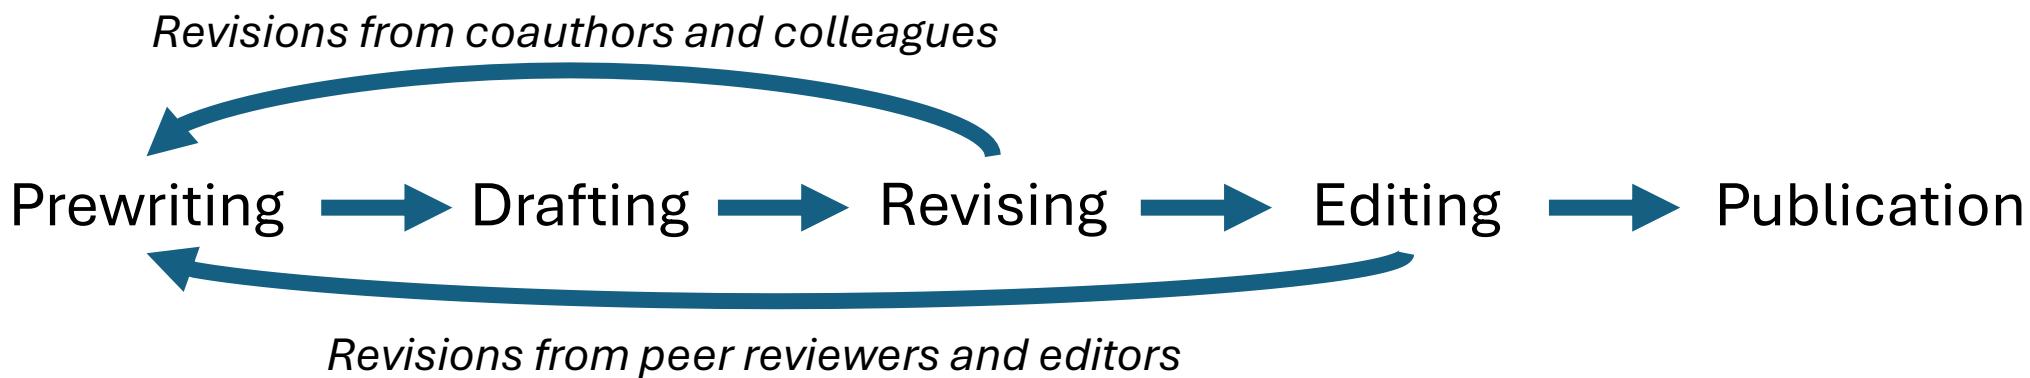

# Scientific writing process

What we think the writing process should be: **linear**.

Prewriting → Drafting → Revising → Editing → Publication

What the writing process actually is: **iterative**.

# Sentence styles

- Past tense, active voice, personal
  - “We conducted an experiment to measure the effects of ultraviolet radiation on the productivity of marine phytoplankton.” 
- Present tense, active voice, personal
  - “We conduct an experiment to measure the effects of ultraviolet radiation on the productivity of marine phytoplankton.” 
- Past tense, passive voice, personal
  - “An experiment was conducted by us to measure the effects of ultraviolet radiation on the productivity of marine phytoplankton.” 
- Past tense, passive voice, impersonal
  - “An experiment was conducted to measure the effects of ultraviolet radiation on the productivity of marine phytoplankton.” 

# Latin phrases

- *et al.* = *et alia* = and others
  - Used to replace multiple names, especially in bibliographic information
- *i.e.* = *id est* = that is/in essence/in other words
  - Used to provide a further definition or clarification
- *e.g.* = *exempli gratia* = for example
  - Used to provide supporting examples that are not exhaustive
- *sensu* = in the sense of
  - Used to denote intended meaning or refer to an authority
- *a priori* = from what is earlier
  - Used to describe knowledge that comes from the power of reasoning based on self-evident truths
- *a posteriori* = from what is later
  - Used to describe knowledge based solely on personal experience, experimentation, or observation

e.g.

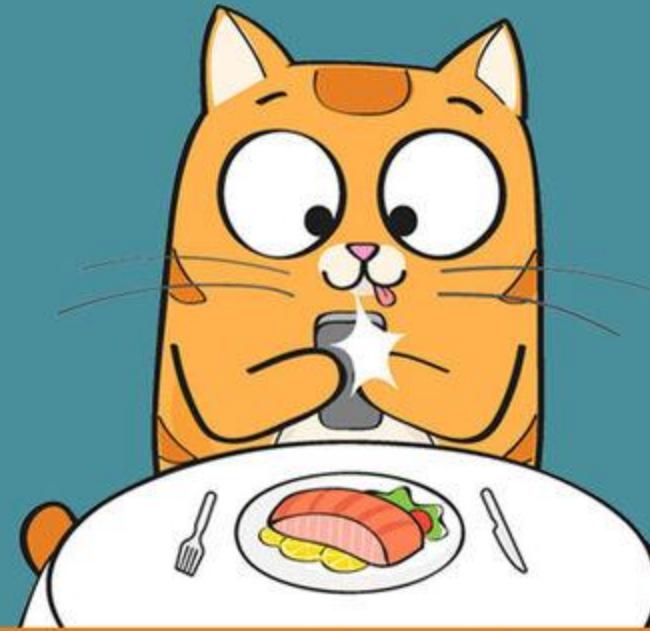

(for example)

i.e.

(in other words)

VS.

YOUR  
DICTIONARY

Kirby likes to eat Italian food (e.g., pizza, spaghetti, and lasagna).

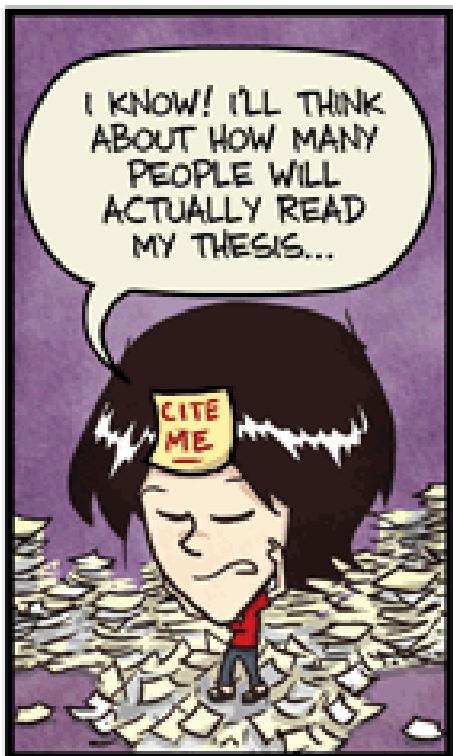

Kirby posted a photo on his social media page (i.e., his food blog).

# Recommended writing order

- 1) Methods – easiest to write, some citations
  - Grandma Meunier: “The hardest part of any job is getting started!”
- 2) Results – next easiest to write, minimal citations
  - Dedicate about 1 paragraph to each figure and table
- 3) Discussion – second hardest to write, considerable citations
  - Start narrow and end broad
- 4) Introduction – hardest to write, maximum citations
  - Start broad and end narrow
- 5) Abstract – summarize everything, no citations

# IV. White Papers

JORGE CHAM © 2010

# What is a white paper?

## Purpose

- Document that describes a problem, proposes solutions, and makes recommendations for a **specific audience**
  - Informative
  - Authoritative
  - Persuasive

## Audience

- In our case, these will be real stakeholders of **your choosing**
  - Resource users
  - Legislators
  - Agency employees
  - Non-governmental organizations
  - Environmental scientists

# What is a white paper?

## Tone and Style

- Although you're advocating for a specific position, you should write **objectively**
  - No opinions or perspectives
  - Present facts substantiated by evidence, figures, tables, and citations

## Format

- Eight component sections
- 12-15 pages in length
  - Single-spaced
  - Not including references

# Cover Page

<b>Section</b>	<b>Criteria</b>	<b>Points Possible</b>
1. Cover Page	1 page maximum	2
a. Title	Title describes the problem.	1
b. Authors and affiliations	Authors and affiliations are listed.	1

# Executive Summary

Section	Criteria	Points Possible
2. Executive Summary	1 page maximum	15
a. Background overview	The most important points from the background section are described concisely.	3
b. Problem overview	The most important points from the problem description section are described concisely.	4
c. Solution overview	The most important points from the solution description section are described concisely.	4
d. Recommendation overview	The most important points from the recommendations section are described concisely.	4

Write this section last!

# Background

<b>Section</b>	<b>Criteria</b>	<b>Points Possible</b>
3. Background		15
a. State of the science	Current scientific understanding is thoroughly discussed with supporting references.	6
b. Relevant policies	Relevant policies at the local, state, and federal levels are described in the context of the problem.	6
c. Audience consideration	The intended audience for the white paper and affected stakeholders are described.	3

# Problem Description

Section	Criteria	Points Possible
4. Problem Description		17
a. Overview of the problem	The problem, its causes, and its impacts are thoroughly described with supporting evidence. <u>At least one figure or table</u> is provided to document the spatiotemporal patterns, causes, or impacts of the problem.	9
b. Stakeholder values	The values of each stakeholder group are defined, and the impacts are related to these values.	4
c. Status quo consequences	The consequences of maintaining the status quo (i.e., doing nothing) are weighed for each stakeholder group.	4

# Solution Description

Section	Criteria	Points Possible
5. Solution Description		18
a. Acceptable solution criteria	All criteria that must be fulfilled by the proposed solutions are described. Criteria must be both necessary (i.e., essential to solve the problem) and sufficient (i.e., all-encompassing for solving the problem).	3
b. First solution	Solution 1 is presented, along with its strengths and weaknesses for the stakeholders. <u>At least one figure or table</u> is provided to document how it would mitigate the problem. Sources are cited in support of the solution.	6
c. Second solution	Solution 2 is presented, along with its strengths and weaknesses for the stakeholders. <u>At least one figure or table</u> is provided to document how it would mitigate the problem. Sources are cited in support of the solution.	6
d. Reasoning	Solutions are logical, pertinent, and well-explained.	3

# Recommendations

Section	Criteria	Points Possible
6. Recommendations		16
a. Plan of action	Recommendations are made from the available solutions, and intended impacts on stakeholders are described. <u>At least one figure or table</u> is provided to support this recommendation. A timeline or workplan is included if relevant.	10
b. Objective tone	Tone is objective, neutral, and formal throughout.	3
c. Feasibility and efficacy	Recommendation is actionable and effectively addresses the stated problem.	3

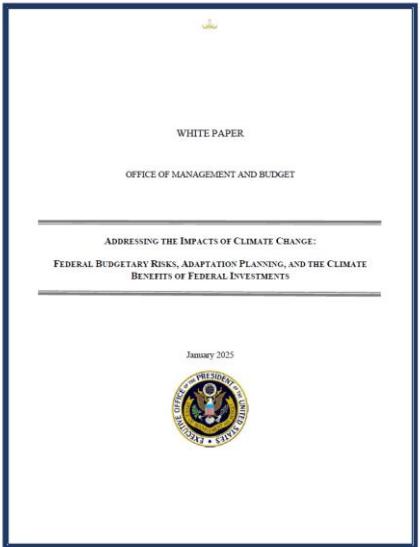

# Conclusions

<b>Section</b>	<b>Criteria</b>	<b>Points Possible</b>
7. Conclusions		9
a. Summary of problem	The case for addressing the problem is restated.	3
b. Summary of solutions	The possible solutions and their impacts on stakeholders are summarized.	3
c. Summary of recommendations	The recommendations made to address the problem are summarized with a look ahead toward follow-up efforts.	3

# References

<b>Section</b>	<b>Criteria</b>	<b>Points Possible</b>
8. References		8
a. Reference number	At least 30 appropriate sources are cited.	4
b. Citation style	Correct and consistent citation style is used.	4
